**GOLDEN BRICK SYSTEMS, INC. LAUNCHES GBRICK.COM AND  
ANNOUNCES LIMITED RELEASE OF GBRICK SMB v1.0**

*Hardware Revolutionizes Email Security by Merging RAE Internet's MPP Platform, Open-Source & Industry Leading Software in a Single Gateway*

**September 21, 2004 - Yorktown Heights, NY-** Golden Brick Systems, an email security solutions provider, announced today the launch of their website, [www.gbrick.com](http://www.gbrick.com) and the limited edition of GBRICKsmb v1.0. GBRICKsmb offers the marketplace an email security solution that is reliable, scalable, and can be customized for each individual business as it changes.

The new product extends the power of leading-edge email security practices to include complete compatibility with open source and the ability to integrate leading proprietary software, a breakthrough (Email Security capability) best practice that provides small and medium businesses with the maximum performance and reliability. GBRICKsmb is easy to install, fully scalable and customizable beyond basic configuration; including extended security / firewall mechanism, elaborated monitoring and notification capabilities, and streamlined system updating and maintenance. The gateway's multi layered approach allows the administrator to pick and choose from a variety of open source and industry leading Anti Virus and Anti SPAM scan engines combining them into a cohesive multi threaded email security platform. This practice results in high quality flexible email protection solution that reduces administrative overhead.

GBRICKsmb is the result of development collaboration of RAE Internet, a virus, spam, and email security solutions provider, their supply chains, and Golden Brick Systems. RAE Internet's MPP (Message Processing Platform) is an Email Security Application which enables virus protection, anti-spam filtering and content for email servers. MPP provides a common feature set and management platform that is fully customizable- customers can mix and match any of the supported scan engines to suit their needs. GBRICKsmb harbors this level of protection in an optimized gateway environment – both hardware and software were optimized and tested for ideal performance, while minimizing security risks.

"RAE Internet's expertise lies in providing our customers with the absolute best virus, email, and spam protection. We seek out the top notch innovative solutions that would be of interest to our customers," said Michael Katz, president of RAE Internet. "When our business needs mandated an expanded utility solution for email security, Golden Brick Systems was exactly what we had in mind. We understand that our customers don't have time or patience to wrestle with a solution that required extensive deployment, training, and consulting. They wanted immediate return on investment, and GBRICKsmb will give them the protection they need right away."

"GBRICKsmb ushers in a new era of email protection," said Gadi Bourla, managing director of Golden Brick Systems. "Merging product design with product platform in a single unified environment makes it significantly easier for businesses to effectively conduct everyday tasks, like opening email with out the worry of software upgrades keeping them up at night. It enables them to manage their email server to its full extent combining industry leading solutions under a single easy to manage gateway. The benefit of knowing in advance the impact of security changes, as well as the associated time savings, allows business to focus on their core competencies."

GBRICKsmb's Datasheet and quick install guide can be found at [www.gbrick.com](http://www.gbrick.com).
